

CIRCUIT TESTER 6-12-24 VOLT

Instructions for use

1. Attach the crocodile clip to a good earthing point on the vehicle.
2. Before proceeding, test for good earth by applying probe to the live battery terminal and tool will light up.
3. Push the probe through the insulation of the 'suspect' wire at various points along its length to identify any breaks in the circuit. A failure of the lamp to illuminate when the probe is correctly positioned indicates that the circuit is not live, and/or is faulty.

Warning:

- Do not exceed the stated voltage of the tool.
- Avoid contact with sharp probe.
- Avoid contact with moving or hot engine parts.
